

Digital Services For a Digital World

Today, many offices have small scanning equipment, but are daunted by the prospect of imaging hundred of files and creating online systems.

Printerger is willing to work at your facility and at your convenience. Point us toward the filing cabinets or guide us through your document storage area. Our friendly, discreet techs can quietly set up a simple system, using familiar programs, and help you with the on-the job assistance.

Final products can be placed on discs, or loaded on an online document server. We can put your files on our server for an interim or long term basis.

Bringing New Life to Media®

IMAGES

Yesterday's problem is accessing media & data files on out dated equipment. Printergy has solved many of these issues.

We can take images off of cell phones, create images from old film & video tape; we scan

35mm negatives strips & slides, and work with x-rays. When done, each project goes through an enhancement step to improve color balance, contrast and brightness.

Images can be printed for a brag book, integrated into a flip book/eBook, or become part of a wedding slideshow or mixed in with highlight sport video. Put'em on Facebook® or back on a cell phone, etc.

Conserving and presenting heritage is important. Let today's solutions address yesterday's technology.

TEXT2SCAN.COM

PDF Services

High speed document scanners scan and image documents into a PDF File. PDF services are available to create **PDF searchable text and M/S Word**. Some services include book-marking, document linking, and Bate stamping.

Document prepared for an Automatic Document Feeder flow through the scanner easily, offer speediest service at the best price point. By removing staples, binding, etc. customers can reduce outsourcing cost.

Large surface, hand fed flat bed scanner service is available for odd sized and delicate items.

Delivery can be on discs, or digital media, or to a Web site.

LET ME EXPLAIN

We can prepare your project for a traditional TV set (Standard Definition—720p), a computer screen or Full Definition (Hi Def—1080p). Scanning and preparation needs differ for both.

At the scanning step, choosing the right Dots Per Inch (DPI) to scan is important. Scanning at 300 DPI for traditional TV sets presents lower labor cost & decreases preparation time. It takes more labor and computer time for HD video. A DPI of 600 DPI for pictures and 3,000 DPI for slides is good. High DPI scans should prevent video pixilization and color shifting when rendered into video.

Printergy can walk you through the decision process between Std Def & Hi Def video effort and cost choice.
